# Structuring the Synthesis of Heap-Manipulating Programs

NADIA POLIKARPOVA, UCSD, USA ILYA SERGEY, University College London, UK

## Introduction

$$\{x \mapsto a * y \mapsto b\} \text{ void swap(loc x, loc y) } \{x \mapsto b * y \mapsto a\}$$

**Intérêt**: Faire avancer l'état de l'art en matière de synthèse de programmes qui manipulent des pointeurs à partir de spécifications fonctionelles formelles.

Idée Clé : Utiliser la logique de séparation.

**Contributions**: Synthetic Separation Logic un systeme de preuve.

Et SuSLik leur synthétiseur

# Spécifications pour la Synthèse

On utilise ici des tas symboliques.

$$\Sigma; \Gamma; \{\mathcal{P}\} \leadsto \{\mathcal{Q}\}|c$$

- ullet  $\Gamma$  : environnement
- ullet  $\Sigma$  : contexte
- $\mathcal{P}, \phi, \mathsf{P}$  : précondition, ses parties pure et spatiale
- ullet  $\mathcal{Q}$ , $\psi$ , $\mathsf{Q}$  : postcondition, ses parties pure et spatiale
- $GV(`, \mathcal{P}, \mathcal{Q}) = Vars(\mathcal{P}) \backslash \Gamma$
- $EV(\Gamma, \mathcal{P}, \mathcal{Q}) = Vars(\mathcal{Q}) \setminus (\Gamma \cup Vars(\mathcal{P}))$

## Règles d'Inférence Basiques

### Un exemple

$$\begin{split} & \underbrace{\operatorname{EMP}}_{\operatorname{EV}(\Gamma, \mathcal{P}, \, Q)} = \emptyset \quad \phi \Rightarrow \psi}_{\Gamma; \; \{\phi; \operatorname{emp}\} \sim \; \{\psi; \operatorname{emp}\} \mid \operatorname{skip}} \\ & \operatorname{READ}_{a \in \operatorname{CV}(\Gamma, \mathcal{P}, \, Q)} \quad y \notin \operatorname{Vars}(\Gamma, \mathcal{P}, \, Q)}_{\Gamma \cup \{y\}; \; [y/a] \{\phi; \langle x, \, \iota \rangle \mapsto a * P\} \sim \; [y/a] \{Q\} \mid c}_{\Gamma; \; \{\phi; \langle x, \, \iota \rangle \mapsto a * P\} \sim \; \{Q\} \mid \operatorname{let} y = *(x + \iota); c} \\ & \operatorname{WRITE}_{\Gamma; \; \{\phi; \langle x, \, \iota \rangle \mapsto e * P\} \sim \; \{\psi; \langle x, \, \iota \rangle \mapsto e * Q\} \mid c}_{\Gamma; \; \{\phi; \langle x, \, \iota \rangle \mapsto e * P\} \sim \; \{\psi; \langle x, \, \iota \rangle \mapsto e * Q\} \mid c}_{\Gamma; \; \{\phi; \langle x, \, \iota \rangle \mapsto e * Q\}}_{\Gamma; \; \{\phi; \langle x, \, \iota \rangle \mapsto e * Q\} \mid c}_{\Gamma; \; \{\phi; P, P, Q\} \sim \; \{\psi; Q\} \mid c}_{\Gamma; \; \{\phi; P, P, P\} \sim \; \{\psi; Q * R\} \mid c}_{\Gamma; \; \{\psi; Q * R\} \mid$$

Fig. 1. Simplified basic rules of SSL.

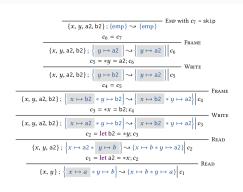

Fig. 2. Derivation of swap(x,y) as  $c_1$ .

## Règles d'Inférence Basiques

- EMP terminale, parties spatiales vide,  $\mathit{EV} = \emptyset$ ,  $\phi \implies \psi$  skip
- READ assigne la valeur d'une GV a une nouvelle variable de programme et substitue toutes les occurences. let b = \*x
- WRITE assigne l'évaluation d'une expression e à une case mémoire.  $\label{eq:write} {}^{*}x = b$
- FRAME Enlève une partie spatiale commune à  $\phi$  et  $\psi$ , si cela ne crée pas de variable existentielle. skip

## Unification Spatiale et Backtrack

$$\{x \mapsto 239 * y \mapsto 30\}$$
 void pick(loc x, loc y)  $\{x \mapsto z * y \mapsto z\}$ 

Avec la substitution  $z \mapsto 239$ , on unfie z et 239.

$${x \mapsto 239 * y \mapsto 30} \rightsquigarrow {x \mapsto 239 * y \mapsto 239}.$$

Introduit du déterminisme et peut alors nécessiter du backtracking!

$$\{x \mapsto a * y \mapsto b\}$$
 void notSure(loc x, loc y)  $\{x \mapsto c * c \mapsto 0\}$ 

Si on lit x dans une variable  $a_2$ , on a le but (impossible)

$${x,y,a_2}{y\mapsto b}\rightsquigarrow {a_2\mapsto 0}.$$

## Raisonner sur les contraintes pures

#### Précondition

$$\{a=x \wedge y=a; x \mapsto y*y \mapsto z\} \text{ void } \text{urk(loc x, loc y)} \text{ } \{\text{true}; y \mapsto a*x \mapsto y\}$$

Deux variables universelles égales, x et y, on substitue.

$$\{x,y\}\{y\mapsto x*x\mapsto z\} \rightsquigarrow \{x\mapsto x*x\mapsto x\}.$$

lci, mène à quelque chose d'impossible  $\implies$  règle d'inconsistence!

## Raisonner sur les contraintes pures

### Les règles

$$\begin{array}{lll} \text{SUBSTLEFT} & \text{STAPARTIAL} \\ \phi \Rightarrow x = y \\ \hline \Gamma; [y/x] \{\phi; P\} \sim [y/x] \{Q\}] c \\ \hline \Gamma; \{\phi; P\} \sim \{Q\}] c \\ \hline \\ \text{SUBSTRIGHT} & x \in \text{EV}(\Gamma, \mathcal{P}, Q) \\ \hline \Sigma; \Gamma; \{\mathcal{P}\} \sim [e/x] \{\psi, Q\}] c \\ \hline \\ \Sigma; \Gamma; \{\mathcal{P}\} \sim \{\psi \land x = e; Q\}] c \\ \hline \end{array} \quad \begin{array}{ll} \text{STAPARTIAL} & \text{INCONSISTENCY} \\ \phi \Rightarrow \bot \\ \hline \Gamma; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\}] c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\} c \\ \hline \\ F; \{\phi; (x, \iota) \mapsto e * \langle y, \iota' \rangle \mapsto e' * P\} \sim \{Q\} c \\ \hline \\ F;$$

Fig. 4. Selected SSL rules for reasoning with pure constraints in the synthesis goal.

## Mémoire dynamique

$$\begin{split} \operatorname{lseg}(x,y,S) & \triangleq x = y \land \{S = \emptyset; \operatorname{emp}\} \\ & x \neq y \land \{S = \{v\} \cup S_1; [x,2] * x \mapsto v * \langle x,1 \rangle \mapsto nxt * \operatorname{lseg}(nxt,y,S_1)\} \operatorname{D\acute{e}fini} \end{split}$$

d'une liste chaînée dont le premier pointeur est x, le dernier y et les éléments sont ceux de S.

## On étend notre langage avec

- Des prédicats inductifs.
- Des blocs de mémoire (et ajout de règles ALLOC et FREE).

Induction

$$\{lseg(x, 0, S)\}\$$
**void**  $listfree(loc\ x)\ \{emp\}$ 

On veut synthétiser la fonction pour libérer une liste chaînée.

Une règle INDUCTION qui

- ajoute la fonction au contexte (permettre les appels récursifs);
- ajoute une étiquette à la fonction (utile pour la terminaison).

$$\Sigma_1 \triangleq \Sigma, \text{listfree}(x') : \{ \text{lseg}^1(x', 0, S') \} \{ \text{emp} \}$$

#### Déroulement de prédicat

Après la règle Induction, une règle Open qui *unfold* la définition du prédicat et génrère deux buts à résoudre.

(i) 
$$\Sigma_1$$
;  $\{x\}$ ;  $\{x = 0 \land S = \emptyset; emp\} \rightarrow \{emp\}$   
(ii)  $\Sigma_1$ ;  $\{x\}$ ;  $\{x \neq 0 \land S = \{v\} \cup S_1$ ;  $[x, 2] * x \mapsto v * \langle x, 1 \rangle \mapsto nxt * lseg^1(nxt, y, S_1)\} \rightarrow \{emp\}$ 

 $c_1$  et  $c_2$  programmes pour (1) et (2), programme final

$$if(x = 0)\{c_1\} else\{c_2\}.$$

## Retour à l'étiquette de niveau

But : éviter les dérivations infinies (ici donne programmes qui ne terminent pas en s'appellant eux-mêmes).

**Idéalement**: prédicats bien-fondés et applications récursives sur tas strictement plus petits.

**Méthode** : avec les tags, on empêche la fonction de s'appeler sur le même tas en post-condition.

## Déroulement dans la postcondition

Si un prédicat inductif dans la postcondition.

Une règle CLOSE.

- Choisit non déterministiquement la partie du prédicat à satisfaire.
- Met à jour la postconditions avec la postcondition de la partie choisie.
- Incrémente l'étiquette.

# Permettre l'appel de procèdure

La validité pour la partie SL est assez similaire au cas plus classique.

- $\langle h, s \rangle \models_{\mathcal{I}}^{\Sigma} \{ \phi; \text{emp} \} \text{ iff } [\![ \phi ]\!]_s = \text{true and dom } (h) = \emptyset.$
- $\langle h, s \rangle \vdash_{I}^{\tilde{\Sigma}} \{\phi; [x, n]\} iff \llbracket \phi \rrbracket_{s} = \text{true and dom } (h) = \emptyset.$   $\langle h, s \rangle \vdash_{I}^{\tilde{\Sigma}} \{\phi; \langle e_{1}, \iota \rangle \mapsto e_{2}\} iff \llbracket \phi \rrbracket_{s} = \text{true and dom } (h) = \llbracket e_{1} \rrbracket_{s} + \iota \text{ and } h(\llbracket e_{1} \rrbracket_{s} + \iota) = \llbracket e_{2} \rrbracket_{s}.$
- $\langle h, s \rangle \models_{\mathcal{T}}^{\mathcal{D}} \{ \phi; P_1 * P_2 \}$  iff  $\exists h_1, h_2, h = h_1 \cup h_2$  and  $\langle h_1, s \rangle \models_{\mathcal{T}}^{\mathcal{D}} \{ \phi; P_1 \}$  and  $\langle h_2, s \rangle \models_{\mathcal{T}}^{\mathcal{D}} \{ \phi; P_2 \}$ .
- $\langle h, s \rangle \models_{\mathcal{I}}^{\Sigma} \{ \phi; p(\overline{x_i}) \}$  iff  $\llbracket \phi \rrbracket_s = \text{true and } \mathcal{D} \triangleq p(\overline{x_i}) \overline{\langle \xi_j, \{\chi_j, R_j\} \rangle} \in \Sigma \text{ and } \langle h, \overline{\llbracket x_i \rrbracket_s} \rangle \in I(\mathcal{D}).$

Definition 3.1 (Sized validity). We say a specification  $\Sigma$ ;  $\Gamma$ ;  $\{P\}$  c  $\{Q\}$  is n-valid wrt. the function dictionary  $\Delta$  whenever for any h, h', s, s' such that

- $|h| \leq n$ ,
- $\Delta$ ;  $\langle h, (c, s) \cdot \epsilon \rangle \rightsquigarrow^* \langle h', (\text{skip}, s') \cdot \epsilon \rangle$ , and
- $\bullet \ \operatorname{dom}(s) = \varGamma \ \operatorname{and} \ \exists \sigma_{\operatorname{gv}} = [\overline{x_i \mapsto d_i}]_{x_i \in \operatorname{GV}(\varGamma, \mathcal{P}, \mathcal{Q})} \ \operatorname{such that} \ \langle h, s \rangle \vDash^{\varSigma}_{I} [\sigma_{\operatorname{gv}}] \mathcal{P},$

it is the case that  $\exists \sigma_{\mathrm{ev}} = [\overline{y_j \mapsto d_j}]_{y_j \in \mathrm{EV}(\varGamma, \mathcal{P}, \mathcal{Q})}$ , such that  $\langle h', s' \rangle \vDash^{\Sigma}_I [\sigma_{\mathrm{ev}} \cup \sigma_{\mathrm{gv}}] \mathcal{Q}$ 

On définit une correction vis à vis de la pré et post condition mais seulement pour des tas de taille n.

Definition 3.2 (Coherence). A dictionary  $\Delta$  is n-coherent wrt. a context  $\Sigma$  (coh  $(\Delta, \Sigma, n)$ ) iff

- $\Delta = \epsilon$  and functions( $\Sigma$ ) =  $\epsilon$ , or
- $\Delta = \Delta', f(\overline{t_i x_i}) \{ c \}$ , and  $\Sigma = \Sigma', f(\overline{x_i}) : \{ \mathcal{P} \} \{ Q \}$ , and  $\operatorname{coh}(\Delta', \Sigma', n)$ , and  $\Sigma'; \{ \overline{x_i} \} ; \{ \mathcal{P} \} c \{ Q \}$  is n-valid wrt.  $\Delta'$ , or
- $\Delta = \Delta', f(\overline{t_i x_i}) \{c\}$ , and  $\Sigma = \Sigma', f(\overline{x_i}) : \{\phi; \lceil P \rceil * p^1(\overline{e_i})\} \{\lceil Q \rceil\}$ , and  $\cosh(\Delta', \Sigma', n)$ , and  $\Sigma; \{\overline{x_i}\} : \{\lceil P \rceil * p^1(\overline{e_i})\} c \{\lceil Q \rceil\}$  is n'-valid wrt.  $\Delta$  for all n' < n.

```
Theorem 3.3 (Soundness of SSL). For any n, \Delta', if
```

- (i)  $\Sigma'$ ;  $\Gamma$ ;  $\{P\} \rightarrow \{Q\} | c$  for a goal named f with formal parameters  $\Gamma \triangleq \overline{x_i}$ , and
- (ii)  $\Sigma'$  is such that  $coh(\Delta', \Sigma', n)$ , and
- (iii) for all  $p^0(\overline{e_i})$ ,  $\phi$ ; P, such that  $\{P\} = \{\phi; p^0(\overline{e_i}) * P\}$ , taking  $\mathcal{F} \triangleq f(\overline{x_i}) : \{\phi; p^1(\overline{e_i}) * [P]\} \{ [Q] \}$ ,  $\Sigma'$ ,  $\mathcal{F}$ ;  $\Gamma$ ;  $\{P\}$  c  $\{Q\}$  is n'-valid for all n' < n wrt.  $\Delta \triangleq \Delta'$ , f  $(\overline{t_i} \ \overline{x_i}) \ \{c\}$ , then  $\Sigma'$ ;  $\Gamma$ :  $\{P\}$  c  $\{Q\}$  is n-valid wrt.  $\Delta$ .

PROOF. By the top-level induction on n and by inner induction on the structure of derivation  $\Sigma';\Gamma;\{\mathcal{P}\}\leadsto\{Q\}|c$ . We refer the reader to Appendix A for the details.
